

WELCOME TO CIS 1.5

Introduction to Computing using C++

Robotics applications

- *Topics:*

- Introduction to the course
- What is a computer programming language?
- What are robotics applications?
- A first computer program.

- *Instructor:*

- Prof Simon Parsons
- parsons@sci.brooklyn.cuny.edu

- *Course web page:*

- <http://www.sci.brooklyn.cuny.edu/~parsons/15-fall-2009>

Introduction to the course

- About this course
 - Introduction to computer programming using the C++ language
 - Uses *robotics* as a *context* (i.e., the basis for examples, homeworks and some of the lab exercises)
- The following topics will be covered in 6 units:
 - (I) Data and Output
 - (II) Control Structures and Input
 - (III) Functions
 - (IV) Arrays and Strings
 - (V) Searching and Sorting
 - (VI) Simple Classes

Course structure

- 6 *units*
- Each unit has:
 - 1-3 *lectures*
 - 2-3 *labs*
 - 1 *assessment*
- The labs will be hands-on sessions using laptops in the classroom (4428 N)
- The assessments will be:
 - Programming assignments
- Your grade = 6 assessments (55%) + a midterm (15%) + one file exam (30%)

How to learn a programming language.

- YOU are responsible for your own learning!!!
- I will point you in the right direction.
- But YOU must PRACTICE, PRACTICE, PRACTICE ...
- and PRACTICE some more!!!
- (If you want to do well, you will need to do more than just the homework).
- If you don't understand, then ASK for help!

What is a program?

- A *computer program* is a set of instructions that tells the computer what to do
- A *computer programmer* is a person who writes those instructions
- There are many different *programming languages* that one can use to write computer programs—
 - In this class, we will learn C++
- C++ is called a *high-level language* because:
 - it is kind of like English (no, really!)
 - well, it is more like English than the *low-level machine language* that the computer understands
- A *compiler* will translate a program from a high-level language into low-level machine language

Which compiler?

- There are lots of C++ compilers and programming environments
- In class, we'll use a free, open source *integrated development environment (IDE)* called "Code::Blocks" (you will see this later)
- With an IDE, you can *edit* your computer program's "source files" and then compile the source files into an *executable application*; and finally you can run the application
- You can use a different IDE if you want to... (we'll talk about this more later)
- Some of the other CIS1.5 sections are using "Dev C++" and "Eclipse"

Getting started

- Programming is like solving puzzles
- Think differently
- The world is now made up of:
 - *objects*
 - *actions*
- Today's introductory topics:
 - Computer basics
 - Our first program

Computer commands

- Computer follows commands
 - *commands = series of instructions*
- You will learn how to *command* a computer
 - *command = program = write instructions*
- Difference between *using* a computer and *programming* it.
 - Programming is taking charge.
- You understand the commands, but does the computer?
 - that's a question of cognition.
 - Artificial Intelligence, Cognitive Science

Computer components

- Computer = hardware + software
- A computer is organized into *logical units*:
 - input
 - output
 - memory
 - arithmetic and logic (ALU)
 - central processing (CPU)
 - secondary storage

Computer instructions

- Set of instructions = *program*
- Types of instructions:
 - machine language
 - assembly language
 - high-level language (e.g., C, C++, Java)
- Program is *compiled* into machine language and then *executed* (*ran*)
- *Executing (running) program = job = process = task*

Machine language

- Lowest level
 - numeric
- Computer is comprised of zillions of *transistors* — *switches* or *relays*
 - switches = ON or OFF
 - relays = OPEN or CLOSED
- Hardware position is abstracted into software as 1's and 0's
- 1's and 0's $\Rightarrow$ *base 2*, or *binary*

Assembly language

- Medium level, but still pretty low; i.e., hard to read and understand
- “English” words and abbreviations
- Examples:

LOAD
ADD
SHIFT
STORE

High-level languages

- Examples: C, BASIC, FORTRAN, Pascal, C++, Java, LISP, Scheme
- Even more like “English”
- High-level languages are
 1. *compiled* into machine language or *object code*
 2. *linked* into *executable code*
 3. *executed* or *ran* as programs

Language examples

- Machine language:
+1300042774
+1400593419
+1200274027
- Assembly language:
LOAD BASEPAY
ADD OVERPAY
STORE GROSSPAY
- High-level language:
grossPay = basePay + overTimePay;

C++

- C++ is an *object-oriented* language: it is structured around *objects* and *methods*, where a method is an action or something you do with the object
- C++ programs are divided into entities called *classes*
- Some C++ classes are *native* but you can also write classes yourself
- C++ programs run as *applications*
- This course only teaches the basics of C++
 - Need to take CIS 15 to learn more.

Our first C++ program

“hello world”

- Typical first program in any language
- Output only (no input)

The source code

```
//-----  
//  hello.cpp  
//  
//  This program demonstrates output in C++  
//  
//  Simon Parsons  
//  2nd September 2008  
//-----  
  
#include <iostream>  
using namespace std;  
  
int main()  
{  
    cout << "This is my c++ world\n";  
    cout << "Hello from inside of it!\n";  
}
```

To do

- Get a copy of the textbook!

- Start to read chapter 1
- Check out the class web page:
<http://www.sci.brooklyn.cuny.edu/~parsons/15-fall-2009>

About me

- Undergrad: University of Cambridge, Engineering, class of 1988
- Grad school: University of London, PhD 1993
- Previous teaching:
 - Queen Mary & Westfield College, London, UK.
 - University of Liverpool, UK.
 - Universidad Politecnica de Catalunya, Barcelona, Spain.
 - Universidad Nacional del Sur, Bahia Blanca, Argentina.
 - Columbia University.
- research interests:
 - Robotics;
 - Software agents and multi-agent systems; and
 - Rational action.

About you.

- Please take out a piece of paper and write down...
 1. Your name
 2. Your class and major OR if you are a non-matriculating student, categorize yourself
 3. Your background in computers, if any
 4. Why you are taking this course
 5. What you hope to get out of this course
 6. One sentence about the best thing you did over the break
- ...and give it to me.

Real world applications

- As a way of explaining *why* we learn the things we learn in this course, we will look at what we can use C++ programs for.
- In particular, we will look at how we can use C++ to control robots.
- We'll do this for a couple of reasons.
- Robots give a nice, concrete, examples.
- Playing with robots is fun.
- The next few slides introduce some aspects of robotics.

Robotics

- Navigation.

Robotics

- Navigation.

Robotics

- Telesurgery.

Robotics

- Surgical robots.

Robotics

- Delivery robots.

Robotics

- Manipulator robots

Robotics

- Soccer playing robots.

Robotics

- Underwater robots.

Summary

- This lecture has introduced the course.
- It has also talked about:
 - Basics of computer programming languages.
 - Described some of the context in which this course will be placed, that of robotics.
- We will come back to the robotics aspects later.
