1.2 Internet Agents

Searching the Internet for the answer to a specific query can be a long and tedious process. So, why not allow a computer program — an agent — do searches for us? The agent would typically be given a query that would require synthesising pieces of information from various different sources, or where results could not be obtained. In particular resource was unavailable, (perhaps due to network failure), or where results could not be obtained.

1 Overview

- Five ongoing trends have marked the history of computing:
 - Ubiquity;
 - Interconnection;
 - Intelligence;
 - Delegation; and
 - Human-orientation.
- Programming has progressed through:
 - Sub-routines;
 - Procedures & functions;
 - Abstract data types;
 - Objects;
 - Agents.

1.1 Spacecraft Control

When a space probe makes its long flight from Earth to the outer planets, a ground crew is usually required to continuously track its progress, and decide how to deal with unexpected events. This is costly and, if decisions are required quickly, it is simply not practical. For these reasons, organisations like NASA are seriously investigating the possibility of making probes more autonomous — giving them richer decision making capabilities and responsibilities. The possibility of making probes more autonomous — giving them richer decision making capabilities and responsibilities.

This is not fiction: NASA's DS1 is doing it now!

LECTURE 1: INTRODUCTION

Multiagent Systems

Lecture 1
An introduction to Multiagent Systems

- Two key problems:

- How do we build agents that are capable of independent, autonomous action in order to successfully carry out the tasks that we delegate to them?
- How do we build agents that are capable of interacting with one another that share the same interests/goals?

- **Agents as a tool for understanding human societies:**
- Multагент systems provide a novel new tool for simulating societies, which may help shed some light on various kinds of social processes.

- An agent is a computer system that is capable of independent action on behalf of its user or owner.
- A multiagent system is one that consists of a number of agents, which interact with one another in order to successfully carry out the tasks that we delegate to them, particularly when the other agents cannot be assumed to cooperate (cooperating, coordinating, negotiating, negotiating) with other agents in order to successfully carry out the tasks that we delegate to them, particularly when the other agents cannot be assumed to share the same interests/goals?
- In order to successfully interact, agents need ability to coordinate, negotiate, and negotiate

important single characteristic of complex software. It is now widely recognised that **interaction** is probably the most understating of the characteristics of complexity in software. It software engineers have derived a progressively better understanding of the characteristics of complex software. It agents as a paradigm for software engineering:

2 Some Views of the Field

- Isn't it all just Social Science?
- Isn't it all Economics/Game Theory?
- Isn't it all AI?
- Isn't it all just Distributed/Concurrent Systems?

3 Objectives to MAS
