exercises for class I.2

___

I. Do this first:

– Copy the "hello world" program that we created during the lecture
– Be careful to follow the instructions on how to use Code::Blocks in the handout I gave you.
– Save the file that contains the program in `hello.cpp`.
– Compile and run your program.

II. Variations:

1. Add another line of output
   – Start with the program from the previous step and create a new program file called **hello2.cpp**. *Hint: to start, use* **File...Save As...** *and give it a new name.*
   – Modify the `main()` to output "hello world" twice.
   – Compile and test your code.

2. Use `endl` instead of `\n`
   – Create another version of your program.
   – Modify it so that it uses the `endl` function instead of the `\n` character.

3. Get creative
   – Create yet another version of your program.
   – Modify the code so that it tells a short (5–10 line) story.
